## 1. Introduction

## 1.1 Objective

The main of this project is use **Market Basket Analysis** to understand customer purchasing behaviour so as improve customer experience whilst improve sales. With transaction data collected on items purchased we aim to understand which items leads to the purchase of other items in other to provide better product recommedation, better product arrangement in malls and online website to ease the stress of buy hence improving customers satisfaction.

### 1.2 Business Problem

• Which products are commonly purchased together?

```

## The Top 5 most sold items from the retail stores are:

- Whole Milk
- Other Vegetables
- Rolls/Buns
- Soda
- Yogurt

Since these are the most purchased items from the retails understanding the consequent items of this sold produts will improve sales and customer statisfaction.

Lets take a dive inside the data using Market Basket Analysis to understand customers purchasing behaviour

### 3.2 Creating a list of list

From the df dataframe we create a bsk daframe which shows the list of item purchased in a single transcation i.e The list on items an individual bought in a single transaction

In [62]: #duplicating my dataframe
bsk = df

#adding coma to the end value in my itemdescription: so when coming the item based on an individual on a single transaction they are separated by coma bsk['itemDescription'] = bsk['itemDescription'].apply(lambda x : x+',') bsk

#### Out[62]:

	Member_number	Date	itemDescription	year	month	day	day_of_week
0	1808	2015-07-21	tropical fruit,	2015	7	21	1

	•••			
	14958	4999	2015-05-16	butter milk,whipped/sour cream,
	14959	4999	2015-12-26	bottled water,herbs,
	14960	5000	2014-09-03	fruit/vegetable juice,onions,
	14961	5000	2014-11-16	bottled beer,other vegetables,
	14962	5000	2015-10-02	soda, root vegetables, semi-finished bread,

14963 rows × 3 columns

```
In [65]: #Creating a list of a list, which is the list of items bought in a single transcation
itemlist = []
for i in range(len(bsk)):
    #appending each list in the itemDescription into the itemList variable without the last value which is the coma
itemlist.append(str(bsk.values[i,2][:-1]))

In [66]: #checking the first list of item purchased in the basket dataframe
bsk.values[0,2]

Out[66]: 'whole milk,pastry,salty snack,'

In [67]: #cross-checking the item on the list with the item in the item list
itemlist[0]

Out[67]: 'whole milk,pastry,salty snack'
```

The (Basket) bsk list of all item purchased in a single transaction

#### In [68]: pd.DataFrame(itemlist) Out[68]: 0 whole milk,pastry,salty snack 0 1 sausage, whole milk, semi-finished bread, yogurt 2 soda,pickled vegetables 3 canned beer, misc. beverages sausage, hygiene articles 4 14958 butter milk, whipped/sour cream bottled water,herbs 14959 fruit/vegetable juice,onions 14960 bottled beer, other vegetables 14961 soda,root vegetables,semi-finished bread 14962

14963 rows × 1 columns

We can see the itemlist created is a pd.Series with list of items.

We split each of the item in the itemlist into different columns the create a dataframe

```
In [69]: #we split each of the item in the itemlist into different columns the create a dataframe
f = pd.Series(itemlist)
itemlist = f.apply(lambda x : pd.Series(str(x).split(',')))
itemlist
```

Since we not getting a lift ratio greater than one i.e (Lift>1), which means a strong association between items. This might be due to the fact Association rules needs to appear in hundreds of transactions to be statistically significant.

Due to this problem, based on this data we try to still understand the data

```
In [76]: #re-arranging the mba dataframe based on the support
    mba.sort_values(by='support', ascending =False)
```

```
fig = px.density_heatmap(data_frame=mba,x='consequents',y='antecedents',z='lift',title='Lift of Association',color_continuous_scale =['white', 'blue', 'green']
pyo.iplot(fig)
```

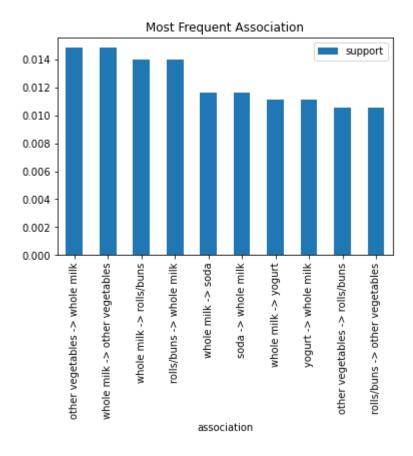

The green tiles shows a strong association rule between the antecedents and the consequents

```
In [79]: d = pd.DataFrame(mba['antecedents']+' '+'->'+' '+mba['consequents']).rename(columns ={0:'association'})
    d['support'] = mba['support']
    d
```

Out[79]:		association	support
	0	other vegetables -> rolls/buns	0.010559
	1	rolls/buns -> other vegetables	0.010559
	2	other vegetables -> whole milk	0.014837
	3	whole milk -> other vegetables	0.014837
	4	whole milk -> rolls/buns	0.013968
	5	rolls/buns -> whole milk	0.013968
	6	whole milk -> soda	0.011629
	7	soda -> whole milk	0.011629
	8	whole milk -> yogurt	0.011161
	9	yogurt -> whole milk	0.011161

```
In [80]: d.sort_values(by='support',ascending=False).plot(kind='bar',y='support',x='association',title='Most Frequent Association')
Out[80]: <AxesSubplot:title={'center':'Most Frequent Association'}, xlabel='association'>
```

The above plot shows the most frequent association of goods. This are the most common products sold together

# 4. Insights

- 1. The Top 5 most sold items from the retail stores are:
  - 1. Whole Milk
  - 2. Other Vegetables
  - 3. Rolls/Buns
  - 4. Soda
  - 5. Yogurt

#### 2. Top 5 products sold together are:

- 1. Other Vegetables and Whole Milk
- 2. Whole Milk and Other Vegetables
- 3. Rolls/Buns and Whole Milk
- 4. Whole Milk and Soda
- 5. Whole Milk and Yogurt

#### 3. There is a strong connection between Whole Milk and other products i.e Individuals who buy Whole Milk tends to buy the following products:

- Other Vegetables
- Rolls/Buns
- Soda
- Yogurt

#### 4. The Retails Store see a strongs increase in demand for products from March to August

#### 4.1 Recommendation

- The Strong association products(i.e correlated goods) should be placed near each other to increase sales and improve customer experience & Satisfaction.
- Discounted price on consequent products to Whole Milk.
- Increase in stock of the top 5 most sold products between the month March and August.
- To improve analysis data collected on customer features like gender,age,occupation,address might improve the analysis of understanding the customer. so a create a more functional recommodation system

### 4.2 Problems encountered

- Due to Data ethnics getting real world transaction data available to the public seams impossible. Hence the data used for analysis is a fake real world dataset download from kaggle.
- Market Basket analysis requires a large amount of data for the result to become significant. Hence the analysis result was based on the data available to us.
